Title:
Design and Execution of Procure-to-Pay (P2P) Cycle Using SAP MM (A Practical Walk through of Vendor On boarding, Order Management, Goods Receipt, Invoice Matching, and Vendor Payment)

Name: Shruti Mahapatra Roll Number: 2305491
Batch: SAP Program B8
Module Focus: SAP MM integrated with SAP FI

Abstract—Procurement without a structured system creates delays, billing disputes, and financial discrepancies that are hard to trace. This project explores how SAP's Materials Management (MM) module addresses these challenges through a well-defined Procure-to-Pay (P2P) framework. Starting from vendor registration through to final payment, every action is logged, validated, and linked to the correct financial entry automatically. The document walks through each stage practically, explains where SAP adds real value, and reflects honestly on what can still be improved.

Index Terms—SAP MM, Procure-to-Pay, P2P, Vendor Master, Purchase Order, Goods Receipt, Invoice Verification, SAP FI, ERP, Payment Processing

I. Problem Statement

Before implementing a structured system, procurement in most organizations is a frustrating experience. Purchase requests disappear in email chains, invoices arrive that do not match what was ordered, and payments go out late because nobody tracked approvals. The result is strained vendor relationships, unreliable inventory figures, and a finance team that cannot close the month on time.

The deeper issue is coordination. Without a system connecting procurement and finance, each department works from its own version of the truth. Purchasing thinks a delivery is complete. Finance thinks the invoice is still pending. The vendor thinks payment is overdue. These misalignment's do not just cause frustration; they cost real money in duplicate payments, missed discounts, and lost supplier goodwill.

This project addresses these problems by implementing the complete P2P cycle in SAP, where every step is recorded, every document is linked, and the financial impact of each action is captured automatically.

II. Solution and Key Features

The solution is the implementation of a complete Procure-to-Pay cycle using SAP MM and FI, ensuring all procurement activities are connected and executed systematically with minimal manual intervention.

- **Single vendor source of truth:** All supplier details live in one vendor master record; any change flows through every subsequent transaction automatically.
- **Self-running procurement flow:** Once a requisition is approved and converted to a purchase order, the system guides the rest of the process without manual hand offs.
- **Instant financial reflection:** Every goods movement and invoice posting immediately creates the corresponding accounting entry in FI with no lag and no manual journal.
- **Built-in three-way match:** SAP compares the vendor's invoice against the PO price and GR quantity before any payment is allowed, protecting against over payments.
- **Complete audit trail:** Every document carries a timestamp and a reference to the document before it, making the full procurement chain traceable in seconds.

III. Detailed Process Flow

The P2P cycle follows six stages. Each stage produces a document in SAP that becomes the input for the next, creating a

connected chain from procurement need to financial settlement. Figure 1 shows the sequence.

P2P Process Flow

Vendor Creation → Purchase Requisition
→ Purchase Order (ME21N)
→ Goods Receipt (MIGO)
→ Invoice Verification (MIRO)
→ Payment Processing (F110 / F-53)

Fig. 1: Procure-to-Pay High-Level Transaction Flow

A. Vendor Creation

Before anything can be purchased, the supplier must exist in the system. The vendor master is split into three views: general data, company code data (payment terms and reconciliation account), and purchasing organization data (ordering currency and intercoms). Getting these right at the start prevents problems at every later stage.

- Vendor name, address, and bank details are entered in the general section.
- Payment terms and reconciliation account 160000 are set in the company code view.
- The purchasing organization is linked so the vendor appears in purchase orders.

Vendor Master Configuration:

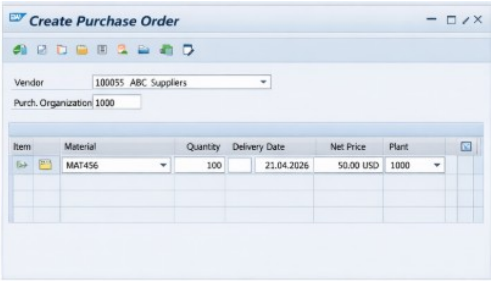
T-Code	XK01 / MK01
Vendor Name	ABC Supplies Pvt. Ltd.
Company Code	TN01
Payment Terms	Net 30
Recon. Account	160000 (Vendor Payables)

B. Purchase Requisition

A purchase requisition is the internal document a department raises when something is needed. It records what material is required, in what quantity, and by when. Once approved, the purchasing team converts it into a purchase order using ME21N, linking the two documents so there is always a clear record of why a purchase was made.

C. Purchase Order Creation

The purchase order is the formal commitment sent to the vendor. Created using ME21N, it references the requisition automatically and drives everything downstream. The goods receipt will reference it; the invoice verification will check against it. Any error made here surfaces again at every subsequent step, which is actually useful because it forces accuracy early.



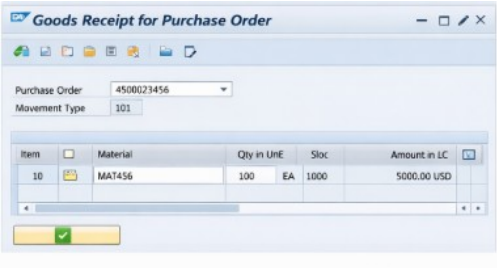
Purchase Order Details:

T-Code	ME21N
Document Type	NB (Standard PO)
Vendor	ABC Supplies Pvt. Ltd.
Material	Raw Material XYZ
Quantity	500 Units @ USD 200.00
Total Value	USD 100,000.00

D. Goods Receipt

When the vendor delivers goods, the warehouse team confirms the delivery in SAP using MIGO. What happens in the background is particularly important: SAP automatically creates an accounting entry debiting the inventory account and crediting the GR/IR clearing account. No

one has to do this manually; it happens through account determination configuration. The GR/IR account sits as a temporary liability until the vendor invoice arrives and clears it.

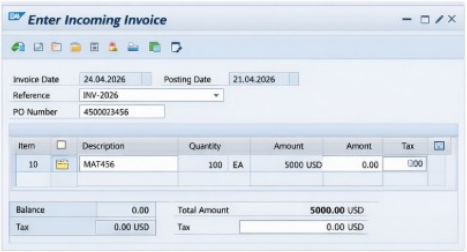


GR Accounting Entry (Auto-Generated):

T-Code	MIGO | Mv. Type: 101
Debit	310000 Inventory Acct
Credit	191100 GR/IR Clearing
Amount	USD 100,000.00

E. Invoice Verification

When the vendor's invoice arrives, it is processed through MIRO. The system performs a three-way match: it compares the invoice amount against the PO price and the GR quantity. If everything aligns within the configured tolerance, the invoice is posted and a vendor liability is created in FI. If not, the invoice is blocked until someone investigates. This control makes paying for goods never received, or overpaying a vendor, significantly harder to do accidentally.

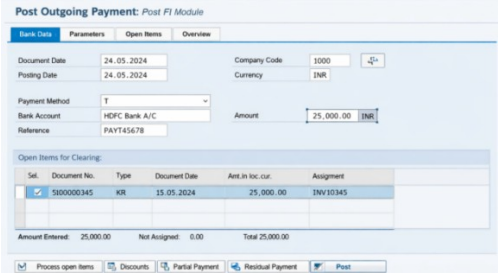


Invoice Verification Entry:

T-Code	MIRO
Match	PO ✓ GR ✓ Invoice ✓
Debit	191100 GR/IR Clearing
Credit	160000 Vendor Payables
Amount	USD 100,000.00

F. Payment Processing

The final step is settling the vendor's account. The automatic payment program F110 picks up all due invoices based on payment terms and processes them in a batch. When payment posts, the vendor's open liability is cleared, the bank account is credited, and the entire cycle for that purchase is complete. Every document from vendor creation to payment is linked in SAP and traceable within seconds.



Payment Accounting Entry:

T-Code	F110 / F-53
Debit	160000 Vendor Payables
Credit	113000 Bank Account
Amount	USD 100,000.00
Vendor Acct	CLEARED

IV. Screenshots and Process Illustrations

The following illustrative SAP screen layouts represent the key transactions executed during the P2P cycle implementation.

Illustrative SAP Screen 1: Vendor Creation (XK01)

Vendor: ABC Supplies Pvt. Ltd.
Co. Code: TN01 Purch. Org.: 1000
Payment Terms: Net 30
Recon. Account: 160000 (Vendor Payables)

Fig. 2: Vendor Creation Screen Layout

Illustrative SAP Screen 2: Purchase Order (ME21N)

Doc. Type: NB Vendor: ABC Supplies
Item Material Qty Price (USD)

0010 Raw Material XYZ 500 200.00
Net Value: USD 100,000.00

Fig. 3: Purchase Order Screen Layout (ME21N)

Illustrative SAP Screen 3: Goods Receipt (MIGO)

Movement Type: 101 (GR for PO)
Qty Received: 500 Units
Debit: 310000 Inventory 100,000.00
Credit: 191100 GR/IR Clearing 100,000.00

Fig. 4: Goods Receipt Screen Layout (MIGO)

Illustrative SAP Screen 4: Invoice Verification (MIRO)

PO Ref: [PO Number] Invoice: USD 100,000
3-Way Match: PO ✓ GR ✓ Invoice ✓
Debit: 191100 GR/IR Clearing 100,000.00
Credit: 160000 Vendor Payables 100,000.00

Fig. 5: Invoice Verification Screen Layout (MIRO)

Illustrative SAP Screen 5: Payment Processing (F110)

Vendor: ABC Supplies Open: USD 100,000.00
Debit: 160000 Vendor Payables 100,000.00
Credit: 113000 Bank Account 100,000.00
Status: VENDOR ACCOUNT CLEARED

Fig. 6: Payment Processing Screen Layout (F110)

V. Financial Integration and Accounting Impact

The most illuminating aspect of this project was seeing how little manual accounting is needed once SAP is configured correctly. Each procurement step triggers an automatic financial posting through account determination. Table I summarizes what happens in the general ledger at each stage.

TABLE I: Accounting Entries Generated at Each P2P Stage

P2P Stage	Debit Account	Credit Account
Goods Receipt	310000 Inventory	191100 GR/IR Clearing
Invoice Verification	191100 GR/IR Clearing	160000 Vendor Payables
Payment Run	160000 Vendor Payables	113000 Bank Account

The GR/IR clearing account is a temporary holding account between goods receipt and invoice posting. When goods arrive, GR/IR is credited instead of the vendor account, because the invoice has not arrived yet. When the invoice is verified, GR/IR is debited and the vendor account is finally credited. At month-end, any remaining GR/IR balance signals either unmatched deliveries or uninvoiced receipts, both of which must be resolved before financial close.

VI. Tech Stack

The following SAP components were used to execute the complete P2P cycle:

- **SAP MM (Materials Management):** Vendor master, requisitions, purchase orders, and goods receipts.
- **SAP FI (Financial Accounting):** Vendor liability, payment processing, and bank account management.
- **SAP GUI:** Desktop interface through which all transaction codes were executed.
- **Account Determination (OBYC):** Configuration linking MM movements to the correct G/L accounts automatically.

- **SAP Standard Reports:** ME2M, MB51, MIR5, FBL1N used for procurement monitoring and vendor analytics.

VII. Unique Points

What makes this implementation stand out is the depth of connection between operational steps and financial consequences. Most P2P descriptions explain what each step does but not how it affects the books. This project bridges that gap by showing the accounting entry generated at every stage alongside the procurement action that triggered it.

The emphasis on three-way matching as a genuine financial control, rather than a procedural checkbox, reflects a more mature understanding of what SAP actually does when it blocks a mismatched invoice. And the practical challenges encountered during execution, such as incomplete vendor master views causing PO errors and GR/IR imbalances at month-end, are documented honestly rather than glossed over.

VIII. Future Improvements

The current implementation covers the core P2P cycle and can be extended in several practical ways:

- **SAP S/4HANA migration:** The Fiori interface makes approvals and monitoring significantly more intuitive, especially on mobile devices.
- **Workflow-driven approvals:** Building approval workflows into SAP would log, track, and auto-escalate requisition approvals without relying on email.
- **Advanced analytics:** Connecting procurement data to Power BI or SAP Analytics Cloud would surface spending patterns and vendor performance trends automatically.
- **AI-assisted vendor selection:** Machine learning applied to vendor performance data could flag suppliers with a history of late deliveries before a new order is placed.

IX. Conclusion

Going into this project, I understood the Procure-to-Pay cycle conceptually. Coming out of it, I understand it practically. There is a real difference between knowing that invoice verification involves a three-way match and actually executing that match in MIRO, watching the system check the values, and seeing what happens when it finds a discrepancy.

What SAP does for procurement is replace uncertainty with structure. Instead of wondering whether a vendor has been paid, you check FBL1N. Instead of guessing whether goods have arrived, you look at the material document in MB51. Instead of hoping the invoice matches the order, MIRO runs the comparison and flags issues before any payment goes out.

The integration between MM and FI was the most valuable lesson of this project. Posting a goods receipt in one module and watching an accounting entry appear automatically in another, with no manual action required, is the kind of thing that is easy to overlook in a textbook but impossible to miss when you are actually doing it. That automatic connection is what makes SAP more than a digital filing cabinet; it makes it a genuinely different way of running a business.

Appendix A
Transaction Codes Reference

TABLE II: Critical P2P Transaction Codes

T-Code	Description
XK01 / MK01	Create vendor master (central / purchasing org)
ME51N	Create purchase requisition
ME21N	Create purchase order
MIGO	Post goods receipt against purchase order
MIRO	Logistics invoice verification (3-way match)
F110	Automatic payment program (batch)
F-53	Post outgoing payment manually
FBL1N	Vendor line item display
F.13	Automatic clearing of GR/IR open items
MB51	Material document list

Appendix B
Month-End P2P Checklist

TABLE III: P2P Month-End Close Checklist

Task	Owner	Status
Confirm all POs are goods-receipted	Procurement Team	Complete
Clear GR/IR account open items (F.13)	GL Accounting	Complete
Verify all invoices posted via MIRO	AP Team	Complete
Execute automatic payment run (F110)	Treasury	In Progress
Reconcile vendor subledger to GL	Finance Controller	Pending
Generate vendor aging and payment report	Corporate Reporting	Pending
